

DC 321 Dry Cow System

"The DC 321 system provides your cows with all the nutrients they need in preparation for their next lactation."

The Key Functions

Manage Liver Fat

Repair Udder Tissue

Improve Cow Immune System

Manage Calcium and prevent milk fever

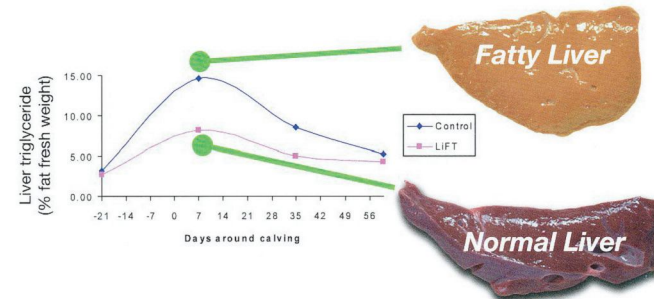

Increase feed intake with the correct energy balance.

Managing Liver Fat

Fat levels in the liver increase as calving approaches, this must be minimised to improve performance and maintain a healthy cow. Trial work has shown how fatty liver can be overcome to improve performance.

By improving liver function, nutrient supply to the udder is increased, ensuring more energy leading to more milk and an improvement in fertility along with reduced Somatic cell counts.

Repairing Udder Tissue

Amino 3 is unique to Dugdale Nutrition, with over 80% by-pass protein (DUP). Feeding high DUP improves colostrum quality increasing calf viability. Quality DUP is needed to replenish the cow protein pool, which increases lactation performance. By reducing body weight loss in early lactation fertility will be improved as cows hold condition better.
